To Whom It May Concern:

I have worked with JS Technologies and Jonathan Serle for 4 years now. Prior to working with Jonathan, I had engaged three different developers over the years starting in 2001 to build and support a web-based database system that allows for public registration, updating, and communication as well as a backend that pretty much runs our call center.

The system is built using the open source LAMP platform, Linux, Apache, MySQL and PHP, plus a great deal of JavaScript.

I must say that before working with Jonathan, our needs changed faster than our developer's ability to fix existing bugs. We limped along with a barely functioning system that often would take 1 step forward and 2 back.

Jonathan was able to change that dynamic and allow us to dream about the future potential of the system. He introduced us to JIRA for task tracking. This helped us organize priorities and track their progress. Within the first year he was able to correct all our problems and deliver new features. He also moved us to an Angular development approach that cleaned up the code and allowed us to develop API tools for use with a mobile app that his team developed.

Since then, we not only added feature after feature but have begun a new online survey project that will integrate with our existing system and which utilizes a mongo database so that we can benefit from data mining in the future. This system appears on track for completion in the estimated 1-year time frame.

Sincerely,

Scott Adleman
